On the Affinity of the Selected AHP Prioritization Procedures

by Pawel Tadeusz Kazibudzki

© Copyright 2021 by Author

THE OBJECTIVE OF THE RESEARCH

- TO ESTABLISH A RELATION BETWEEN 'GENUINE' AND ESTIMATED PRIORITY VECTORS DERIVED FROM SIMULATED PAIRWISE JUDGMENTS
- GOOD OR POOR RELATION WILL REFLECT QUALITY
 OF SELECTED ESTIMATION TECHNIQUES

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics in Katowice,

ASSUMPTIONS

GOOD OR POOR RELATIONS ARE INDICATED BY:

Mean Spearman Rank Correlation Coefficient (MSRC) Mean Pearson Correlation Coefficient (MPCC) Mean Average Absolute Deviation (MAAD) average Root Mean Squared Deviation (aRMSD)

$$MAAD(w, \hat{w}) = \frac{1}{n} \sum_{i=1}^{n} |w_i - \hat{w}_i| \qquad aRMSD(w, \hat{w}) = \sqrt{\frac{1}{n} \sum_{i=1}^{n} (w_i - \hat{w}_i)^2}$$

where w and \hat{w} denote the 'true' priority vector and its estimate, consecutively.

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics in Katowice, Pol.

In order to clarify the examination method we are presenting the simplified example now.

For the illustration purpose we take into consideration only technical perturbation of PCMs resulting from rounding errors during application of Saaty's scale and standard requirement within AHP i.e. forced reciprocity.

Let's consider the following hypothetical model of the AHP framework with three levels (four criteria and four alternatives):

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics in Katowice

- PRELIMINARIES -PAIRWISE COMPARISONS SCALES

Intensity of Importance	Definition
1	Equal Importance
3	Moderate Importance
5	Strong Importance
7	Very Strong Importance
9	Extreme Importance
2, 4, 6, 8	For compromises between the above
Reciprocals of above	In comparing elements i and j - if i is 3 compared to j - then i is 1/3 compared to i
Rationals	Force consistency Measured values available

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics

- PRELIMINARIES -PAIRWISE COMPARISONS SCALES

Other numerical scales also exist for example various types of geometric scales.

Their most popular version consists of the numbers computed in accordance with the formula $2^{n/2}$ where *n* comprises the integers from minus eight to eight.

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics in Katowice, I

Hypothetical Pairwise Comparison Matrix (PCM) reflecting a given Priority Vector (PV)

_w _n /w ₁	w_n/w_2	w_n/w_3	• • •	w_n / w_n		_w _n _		_nw _n _

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Econo

with respect to the GOAL:

	<i>C</i> 1	<i>C</i> 2	<i>C</i> 3	<i>C</i> 4	$H_{G}PV_{C}$
<i>C</i> 1	[1	1.4	3.5	1.16667	[0.35]
<i>C</i> 2	0.714286	1	2.5	0.833333	0.25
<i>C</i> 3	0.285714	0.4	1	0.333333	0.10
<i>C</i> 4	0.857143	1.2	3	1	0.30

with respect to criteria C1–C2:

	<i>A</i> 1	A2	A3	A4	$H_{C2}^{C1}PV_A$
<i>A</i> 1	1	1.4	2.33333	1.4^{-}	[0.35]
A2	0.714286	5 1	1.66667	1	0.25
A3	0.428572	1 0.6	1	0.6	0.15
A4	0.714286	5 1	1.66667	1	0.25

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Econor

with respect to criteria C3–C4:

	<i>A</i> 1	A2	A3	A4	$H_{C4}^{C3}PV_A$
<i>A</i> 1	[1	0.666667	0.285714	0.25	$\begin{bmatrix} 0.10 \end{bmatrix}$
A2	1.5	1	0.428571	0.375	0.15
A3	3.5	2.33333	1	0.875	0.35
A4	$\lfloor 4$	2.66667	1.14286	1	0.40

where $H_{G}PV_{A}$, $H_{C2}^{C1}PV_{A}$, $H_{C4}^{C3}PV_{A}$ denote partial hypothetical PV in the model.

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics in Katov

After standard AHP synthesis, the hypothetical total PV (HTPV) is obtained HTPV= $[0.25, 0.21, 0.23, 0.31]^{T}$.

Next, we are going to perturb every PCM in the presented framework. The scenario assumes application of the rounding procedure and also takes into account the obligatory assumption in conventional AHP applications i.e. the PCM reciprocity condition. In such cases, only judgments from the upper triangle of a given PCM are taken into account and those from the lower triangle are replaced by the inverses of the former. Then, on the bases of such PCMs and with application of the REV we compute their respective partial PVs (PPV_{REV}). Finally we compute the total calculated priority vector $(TCPV_{REV})$ for the exemplary model of the AHP.

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics in Kato

Perturbed Pairwise Comparison Matrix (PPCM) and Priority Vector derived from PPCM

$$\begin{bmatrix} x_{1}/x_{1} & x_{1}/x_{2} & x_{1}/x_{3} & \dots & x_{1}/x_{n} \\ x_{2}/x_{1} & x_{2}/x_{2} & x_{2}/x_{3} & \dots & x_{2}/x_{n} \\ x_{3}/x_{1} & x_{3}/x_{2} & x_{3}/x_{3} & \dots & x_{3}/x_{n} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ x_{n}/x_{1} & x_{n}/x_{2} & x_{n}/x_{3} & \dots & x_{n}/x_{n} \end{bmatrix} \times \begin{bmatrix} w_{1} \\ w_{2} \\ w_{3} \\ \vdots \\ w_{n} \end{bmatrix} = \lambda_{\max} \begin{bmatrix} w_{1} \\ w_{2} \\ w_{3} \\ \vdots \\ w_{n} \end{bmatrix}$$

with respect to the GOAL:

with respect to criteria C1–C2:

with respect to criteria C3–C4:

	A	1 A2	A3	A4		PPV_{REV}^{C3C4}
<i>A</i> 1	[1	1/2	1/4	1/4	[().0887547
A2	2	1	1/2	1/3	().1611320
A3	4	2	1	1	().3550190
A4	$\lfloor 4$	3	1	1).3950950

After standard AHP synthesis, the following result is obtained TCPV_{RFV}=[0.2034, 0.2336, 0.2316, 0.3315]^T which is different from $HTPV = [0.25, 0.21, 0.23, 0.31]^{T}$. Comparing HTPV with its estimate TCPV_{RFV} we can compute earlier mentioned performance measures i.e. MSRC, MPCC and MAAD which reflect estimation quality of the REV. For the presented example we have SRCC=0.2, PCC=0.8142, MAD=0.023325. Noticeably, in this way we can compare estimation quality of any priority deriving method available for AHP.

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics in Katow

SELECTED ESTIMATION TECHNIQUES FOR THE AHP

The Prioritization Procedure	Formula for the Prioritization Procedure
Simple Normalized Column Sum – SNCS –	$w_{i(SNCS)} = \frac{1}{n} \sum_{j=1}^{n} \left(a_{ij} / \sum_{k=1}^{n} a_{kj} \right)$
Logarithmic Least Squares Method – LLSM –	$w_{(LLSM)} = \min \sum_{i=1}^{n} \sum_{j=1}^{n} \ln^2 \left(a_{ij} \frac{w_j}{w_i} \right)$
Right Principal Eigenvector – REV –	$w = \lim_{k \to \infty} \left(\frac{A^k \times e}{e^T \times A^k \times e} \right)$
Logarithmic Utility Approach – LUA –	$w_{(LUA)} = \min \sum_{i=1}^{n} \ln^2 \left(\sum_{j=1}^{n} \frac{a_{ij} w_j}{n w_i} \right)$

SELECTED PROBABILITY DISTRIBUTIONS OF PERTURBATION FACTOR (e)

Additionally, in order to reflect somehow human judgment imperfections we can implement to the presented scenario random errors i.e.

$$\mathbf{x}_{ij} = \mathbf{e}_{ij} \mathbf{W}_{ij}$$

Usually recommended for (e) are such types of probability distributions (PD) as: *gamma, log-normal, truncated normal,* or *uniform.* Apart from these most popular, one can find applications of the PD: *Couchy, Laplace,* and *triangle* or *beta.*

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics in Katowic

Simulation results of comparative studies concerning the LUA and the REV for 1000 randomly generated single RTPCMs

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics in Katov

In second examination we generate randomly one hundred 'true' PVs (uniform probability distribution) of the assigned size *n* x 1 what gives us one hundred PCMs created on the bases of each of them (perfectly consistent matrices A(w) of the size $n \ge n$. Then, we perturb one hundred times each PCM generated in this way following the earlier presented formula, where e_{ii} has uniform probability distribution within certain assigned intervals: [0.8, 1.2], [0.5, 1.5] and [0.2, 1.8]. Next, we calculate PVs: W_{IIIA} and W_{RFV} on the bases of these matrices with the application of the LUA and the REV, respectively.

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics in 1

Then, we compare such obtained results with the values of original 'true' PVs. Thus, we analyze ten thousands cases for each given n and the size of the interval for e_{ii} .

In order to evaluate the performance of the LUA and the REV, we calculate earlier mentioned measures i.e. MSRC and MPCC between approximated and 'true' PVs. Additionally, we compute also other, known from literature performance measures, i.e. MAAD and average Root-Mean-Square-Deviation (aRMSD)

International Workshop on Multiple Criteria Decision Making Department of Operations Research, University of Economics in Katowice, P

CONCLUSIONS

 \Rightarrow both procedures taken into consideration in this research are very competitive;

⇒the REV and the LUA comparative evaluation leads to a conclusion that the REV, in some circumstances, may provide even worse than the LUA, estimation results of decision makers true priorities;

 \Rightarrow the phenomena observed in this research concerns the entire AHP model (not only single PCM).
